Synthetic intraday return

An original engineering fixture for Paper-to-Alpha

Purpose

This note is an original project-authored software fixture.
It is not an academic paper, an investment hypothesis, or a strategy result.

Executable definition

```
close / open - 1
```

Declared convention

The signal describes the completed session's open-to-close change.
Daily close is available only after the session closes.
The local evaluation places higher signal values on the long side.
That direction is a demo convention, not an established economic mechanism.

Input and evaluation

Use deterministic synthetic OHLCV, twelve synthetic assets, and weekday dates.
Evaluate on the declared validation interval; keep test evaluation locked.
The local label enters at the next open and exits at the following open.
No transaction costs, slippage, borrowing, or execution model is included.

Acceptance scope

A successful run demonstrates PDF evidence checks and actual factor calculation.
Saved metrics, events, input snapshots, and reports can then be verified.
Metrics on this synthetic fixture provide no evidence of investment performance.
